October 18, 2026

Dear Hiring Team,

I am interested in senior front-end engineering and AI application roles where I can make complex systems useful to the people working with them. I have built production web software for enterprise platforms, health technology, and federal programs, and I continue to build and operate my own applications and infrastructure.

At Decipher Technology Studios, I developed React and Redux-Saga interfaces around data visualization and document and video processing, then contributed Go ingestion services connected to Kafka. Before that, I led front-end work on Deltek's transition from Vision to the browser-based Vantagepoint platform. At Code Jamboree, I work in React, TypeScript, testing, and localization, translating designs into usable components and maintaining applications across technology generations.

My recent projects show the direction I want to take that experience. I built a React/TypeScript explorer for public financial records, D64 Storage Lab for visualizing and repairing Commodore disk images, and Zogograph, a server-monitoring product with AI diagnostic tool calls and cost tracking. Local Agent Lab is a React/TypeScript browser workspace for coding, research, and scheduled agents, with local models, optional Ollama and API profiles, and portable project storage. I also run an OpenClaw/Forgejo workflow in which agents take and review tasks, build runners deploy previews, and my cPanel integration creates test subdomains with SSL. That work keeps me close to model behavior, operational constraints, and reliable delivery.

I would bring a broad engineering view to a team: careful UI work, comfort with services and data, and a habit of testing what a system actually does. I would welcome a conversation about the problems your team is solving and where my experience could help.

Sincerely,

Lewis Moten
